

ORACLE®

Consolidate and Prepare for Cloud Efficiencies

Oracle Database 12c – Oracle Multitenant Option

Eric Rudie

Master Principal Sales Consultant

Oracle Public Sector

27 September 2016

Safe Harbor Statement

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle's products remains at the sole discretion of Oracle.

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment
- 5 Upgrading to Multitenant
- 6 Use Cases

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment
- 5 Upgrading to Multitenant
- 6 Use Cases

Business Drivers

Customers face great pressure to consolidate databases in cloud

Economic Pressures

Consolidate to cut costs

- Fewer servers
- Less power
- Less floor space
- Lower license costs

Operational Pressures

Deliver cloud-based agility

- Simplified management
- Flexible load balancing
- Rapid self-service provisioning

Requirements

- **Tenant isolation**
- **Easy adoption**
- **Manage many as one**
- **Retain granular control**

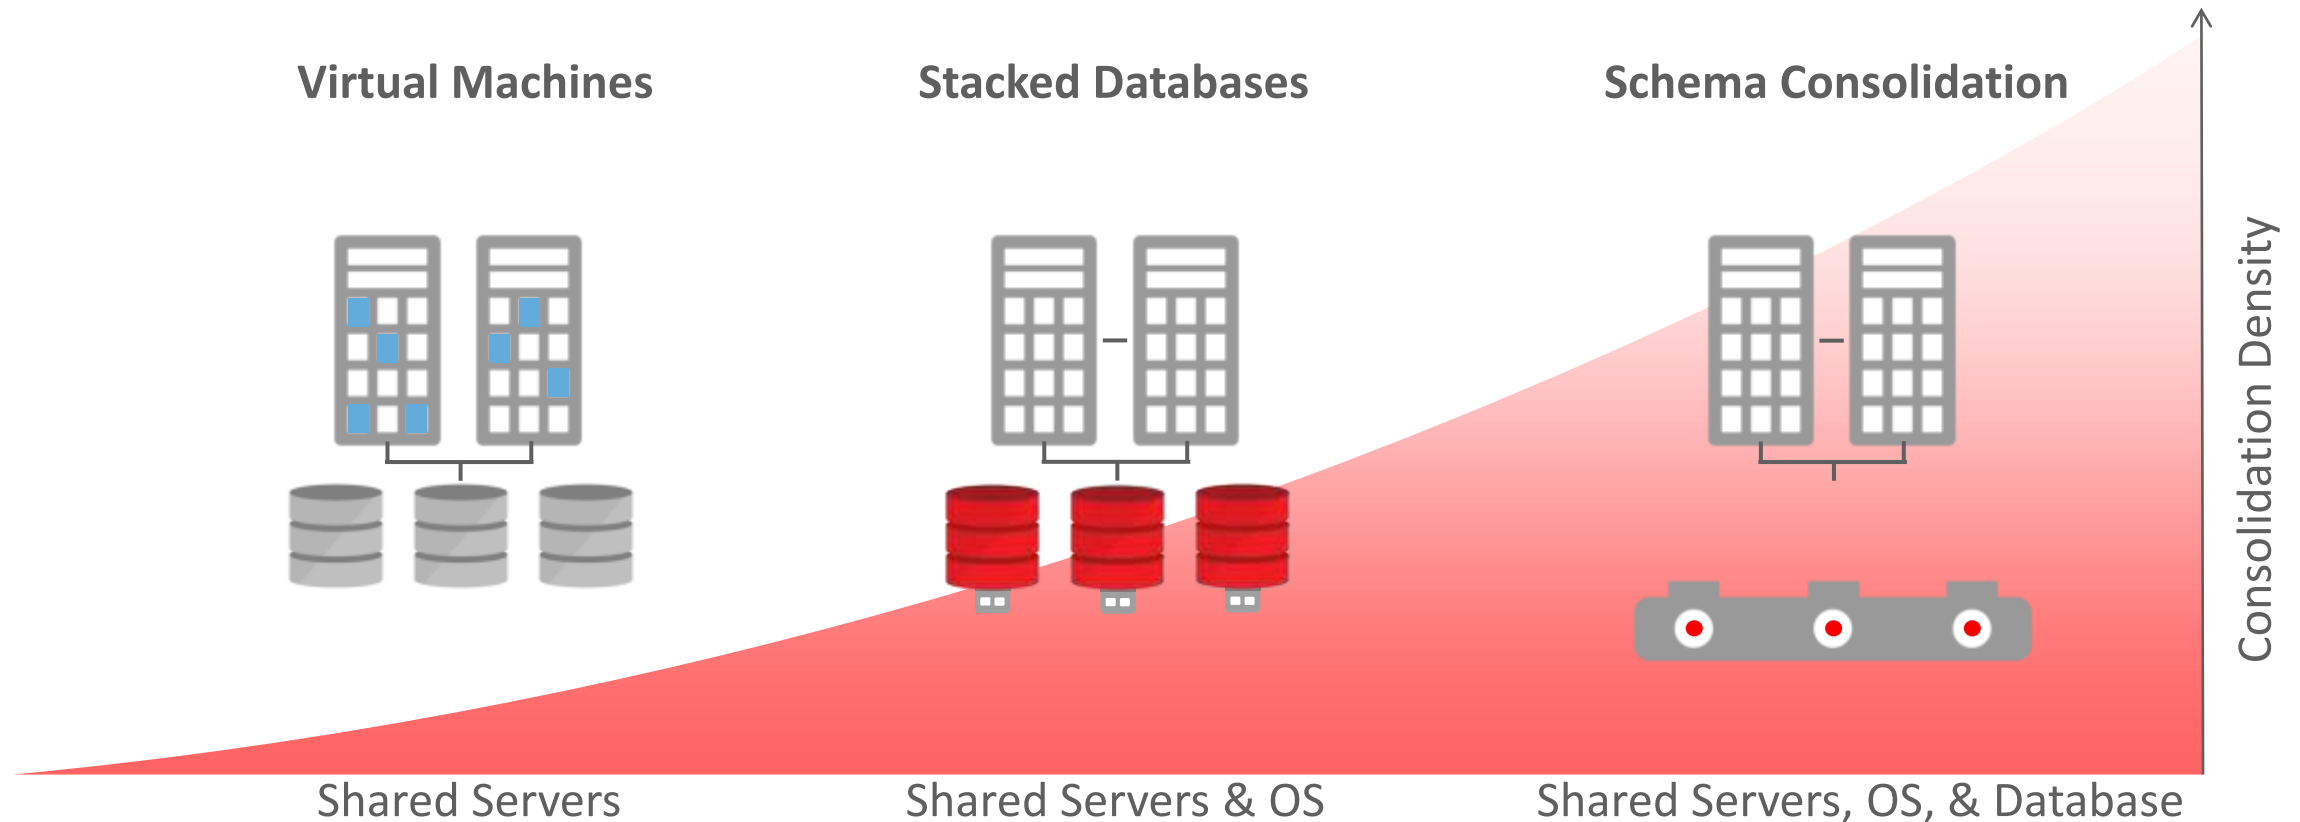

Database Consolidation on Clouds

Traditional consolidation methods

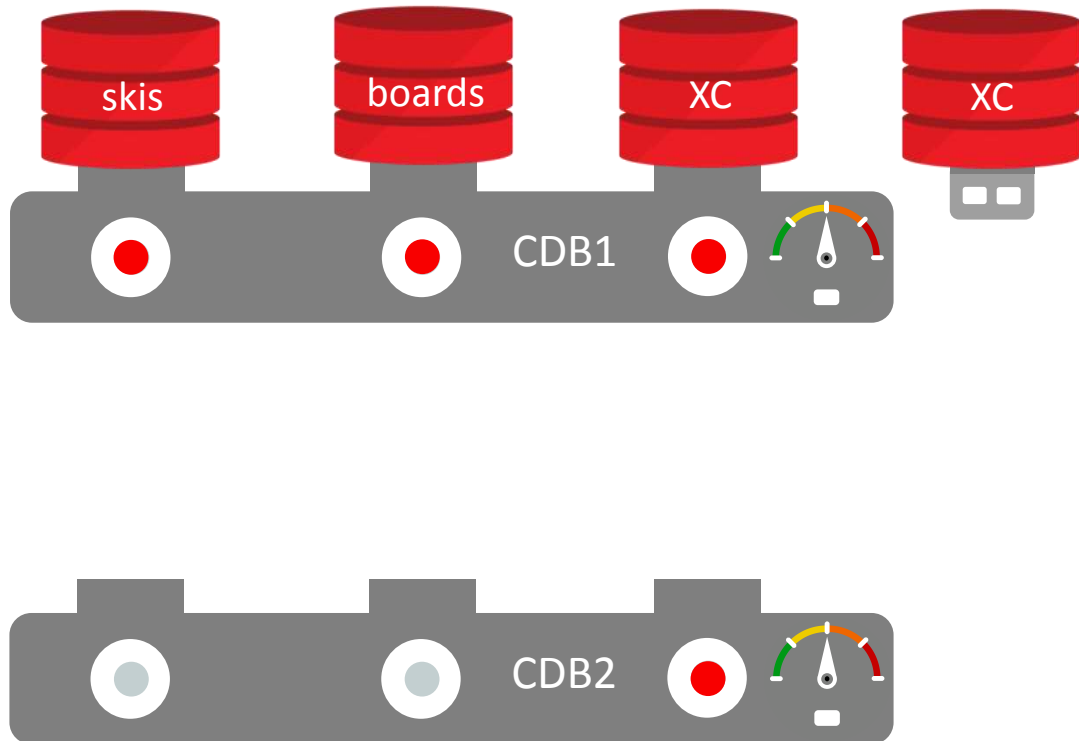

Cloud Database Design Goal: Efficiency

CapEx and OpEx reduction comparable to schema consolidation, with no downsides

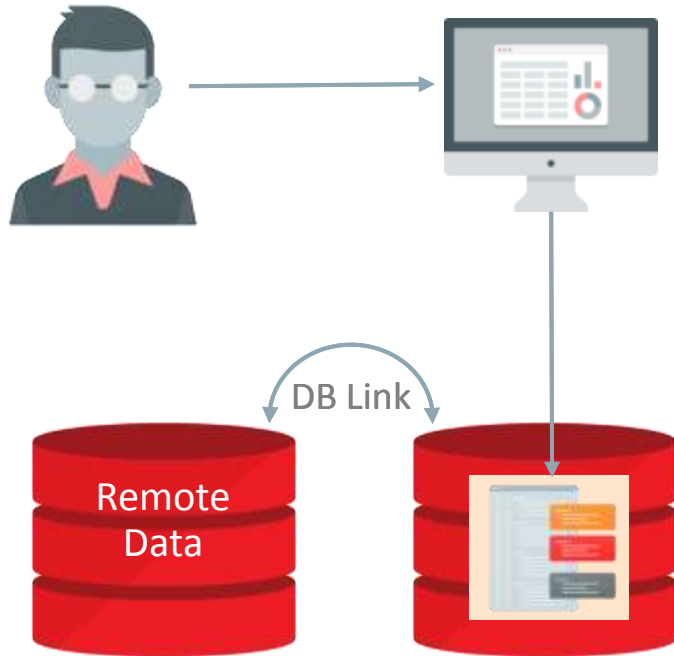

Cloud Database Design Goal: Portability

- A pluggable database is a portable database
- Simply unplug from the old CDB...
- ...and plug it into the new CDB
- With shared storage, moving between CDBs is a simple case of moving a PDB's metadata
- An unplugged PDB carries with it lineage, opatch, encryption key info etc.

Cloud Database Design Goal: Compatibility

Legacy non-CDB Architecture

- PDB / non-CDB compatibility guarantee:

You cannot tell, from the viewpoint of a connected client, if you're using a PDB or a non-CDB

Multitenant Architecture

- **Applications run unchanged**

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment
- 5 Upgrading to Multitenant
- 6 Use Cases

Oracle Database Architecture

Requires memory, processes and database files

System Resources

GL

OE

AP

New Multitenant Architecture

Memory and processes required at container level only

System Resources

New Multitenant Architecture

More efficient utilization of system resources

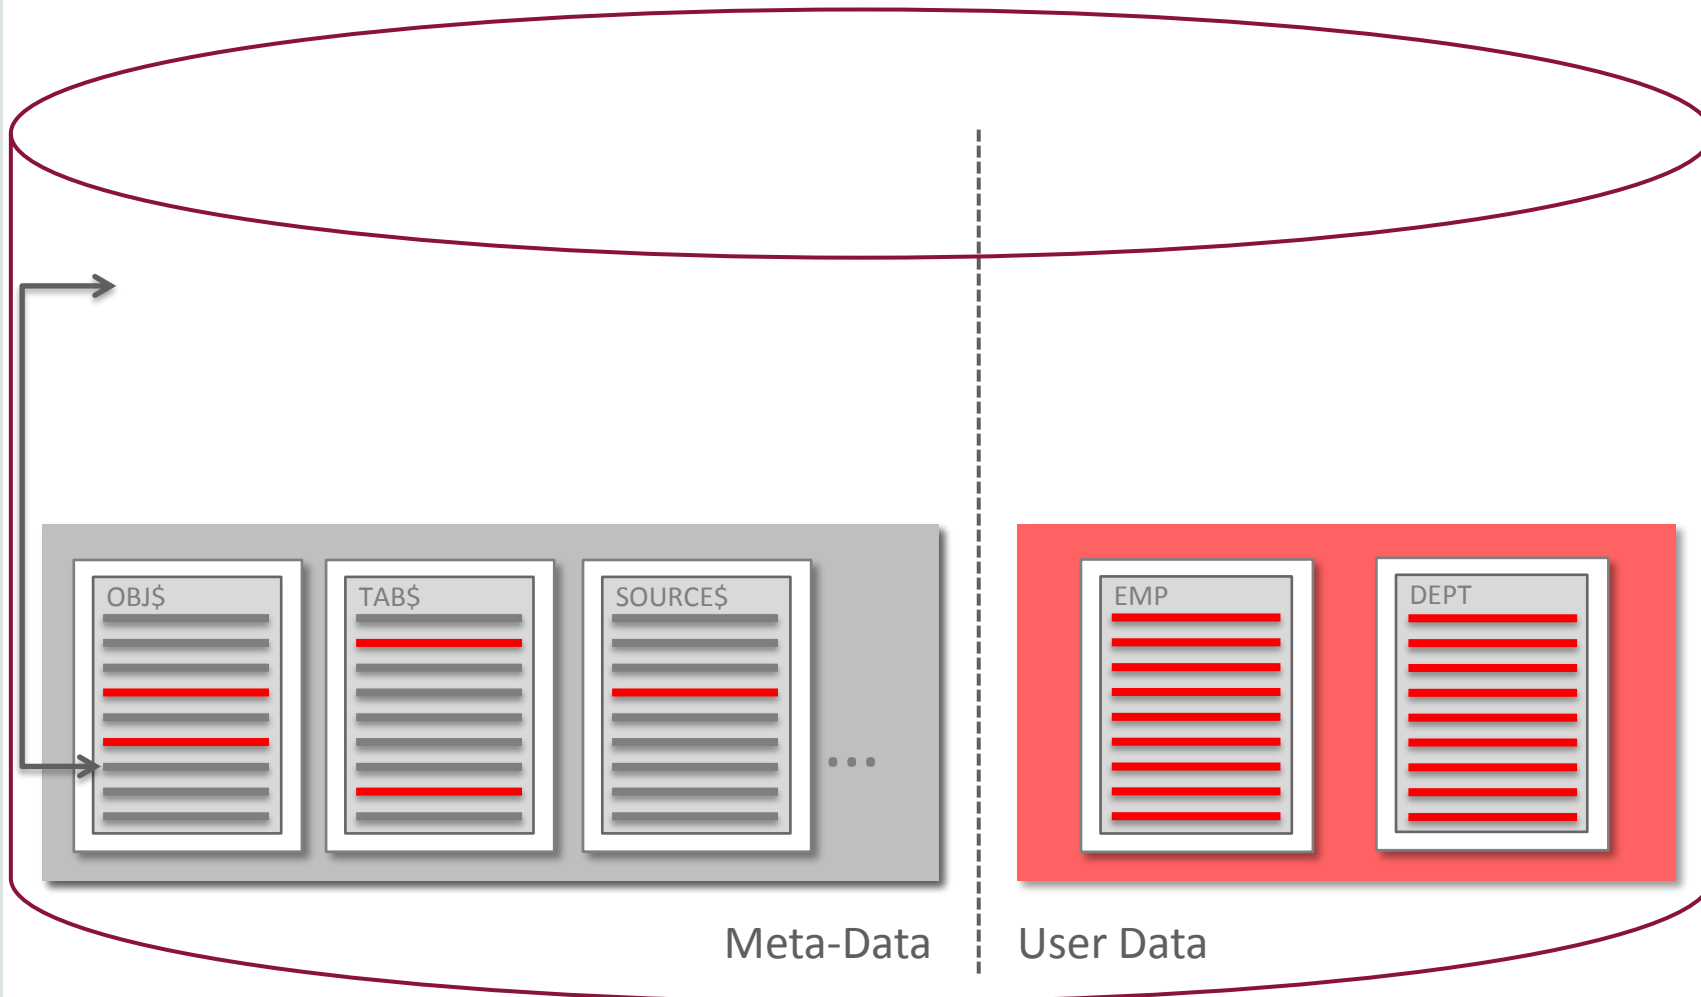

System Resources

Oracle Data and User Data

Before 12.1: Oracle and user data intermingle over time

- New database contains Oracle meta-data only
- Populate database with user data
 - Oracle and customer meta-data intermingled
 - Portability challenge!
- Multitenant fix:
Horizontally-partitioned data dictionary
 - Only Oracle-supplied meta-data remains in root

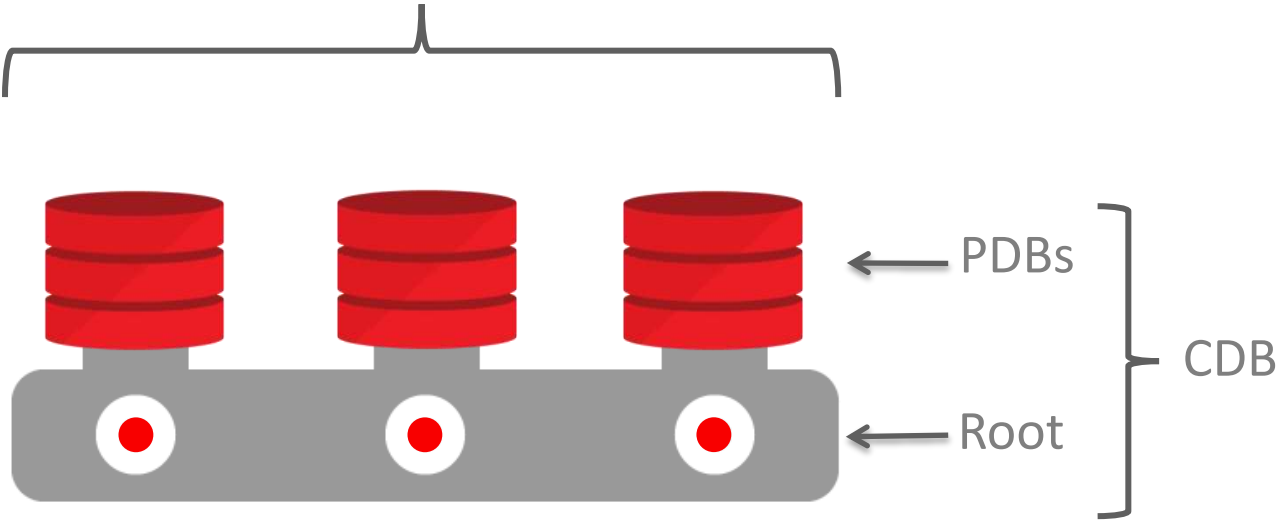

Multitenant Architecture

Components of a Multitenant Container Database (CDB)

- Up to 252 PDBs per CDB

Pluggable Databases

Multitenant Container Database

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment
- 5 Upgrading to Multitenant
- 6 Use Cases

Manage Many Databases as One

Backup databases as one; recover at pluggable database Level

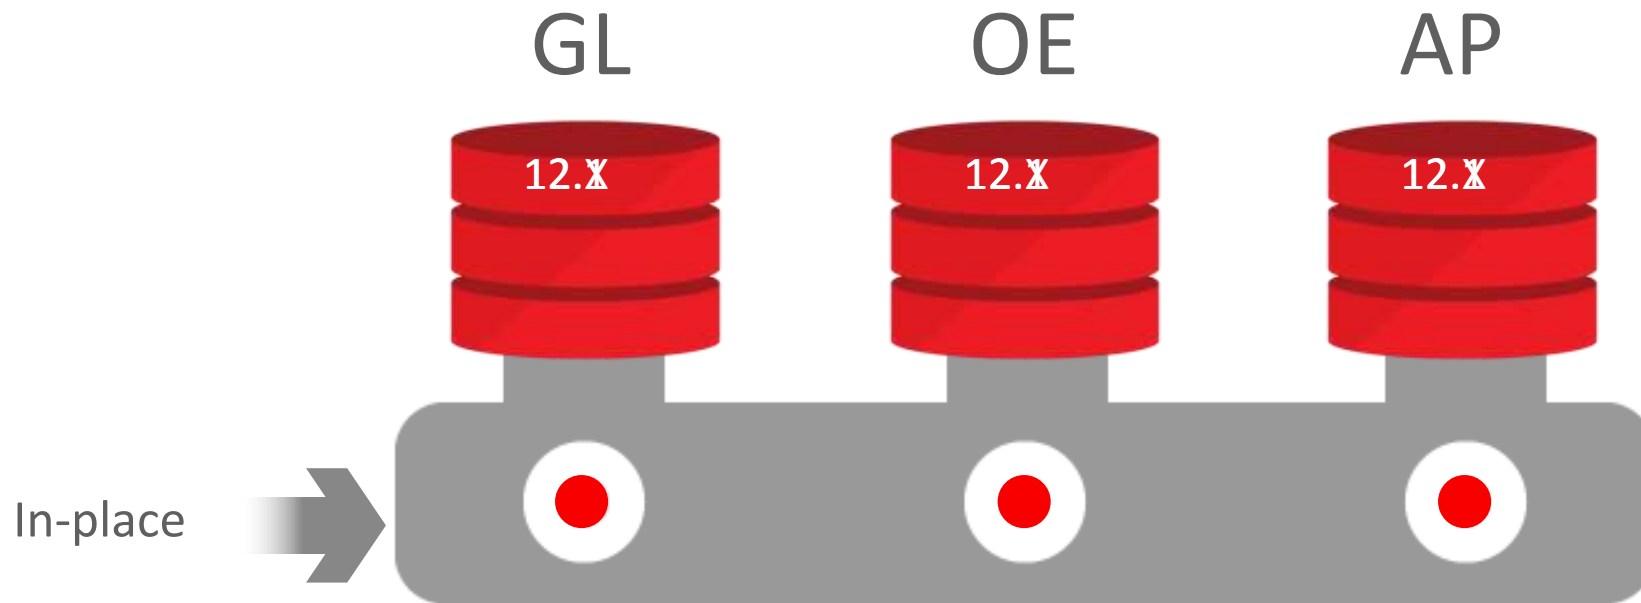

Manage Many Databases as One with Multitenant

One standby database covers all pluggable databases

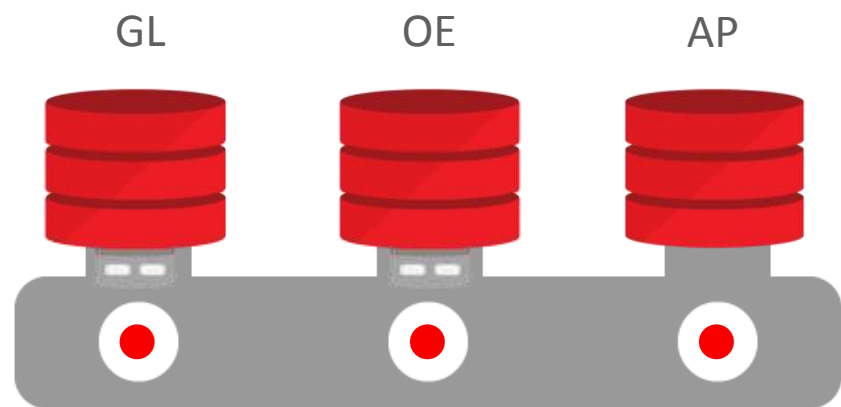

Simplified Patching and Upgrades

Apply changes once, all pluggable databases updated

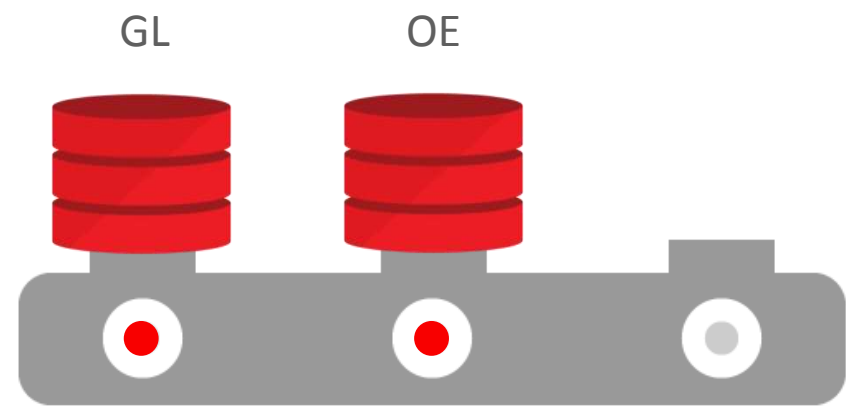

Simplified Patching and Upgrades

Flexible choice when patching & upgrading databases

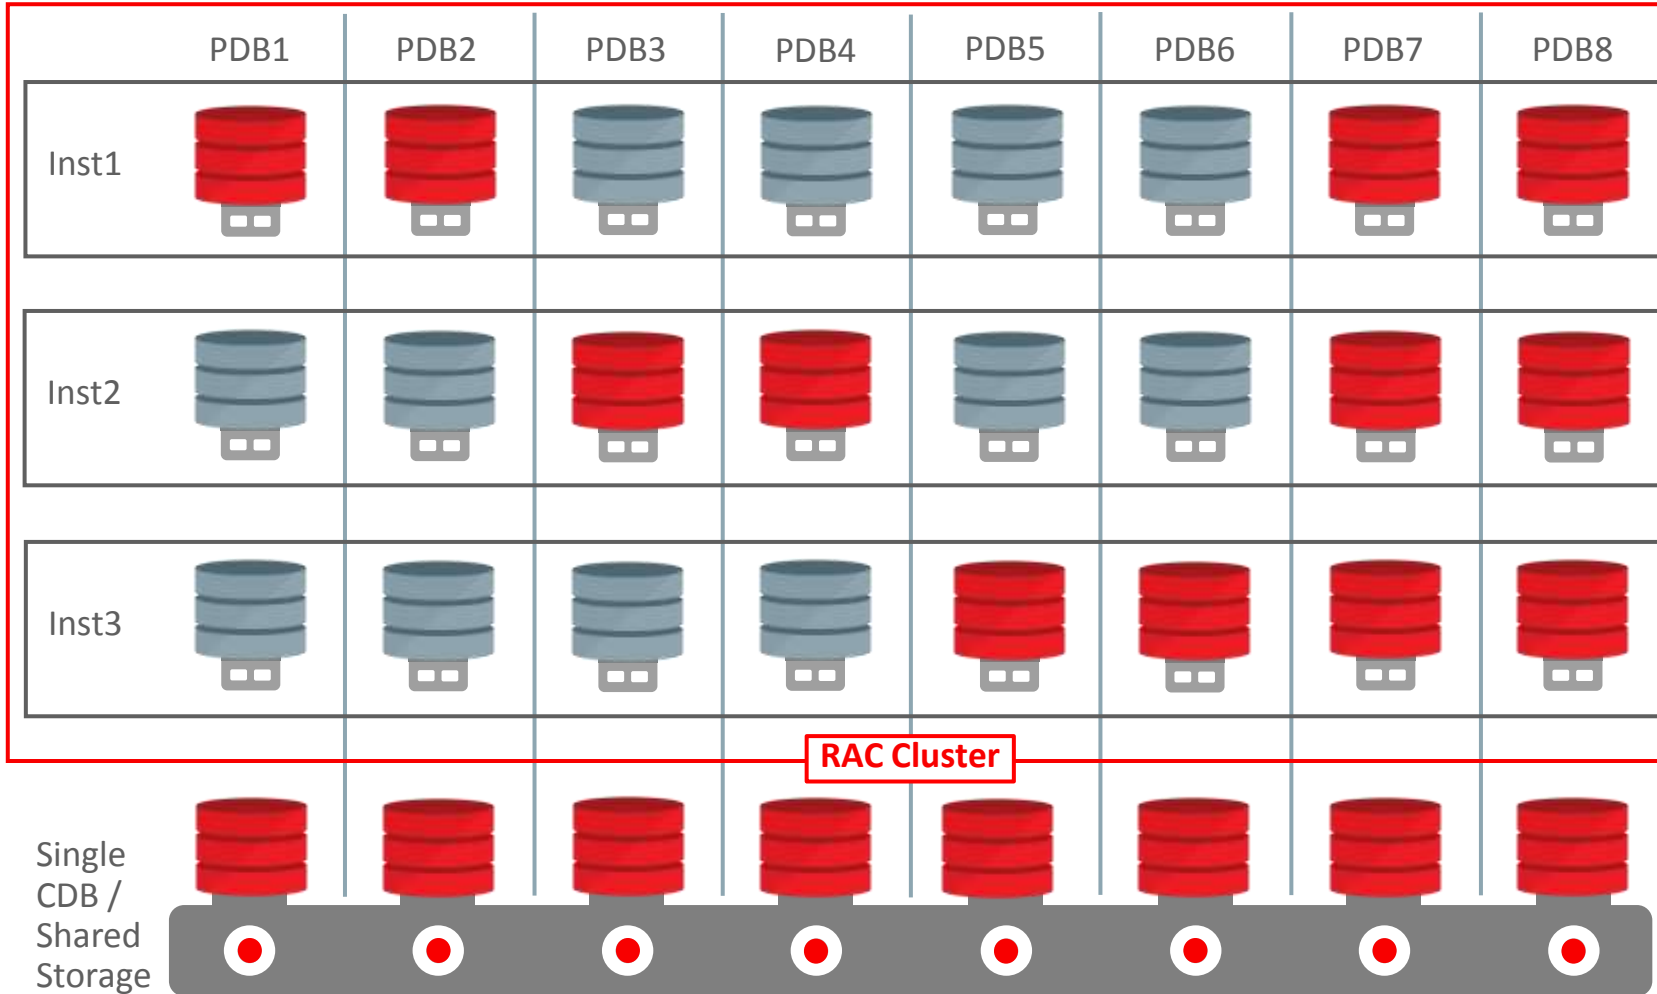

Original Container Database 12.1

Upgraded Container Database 12.x

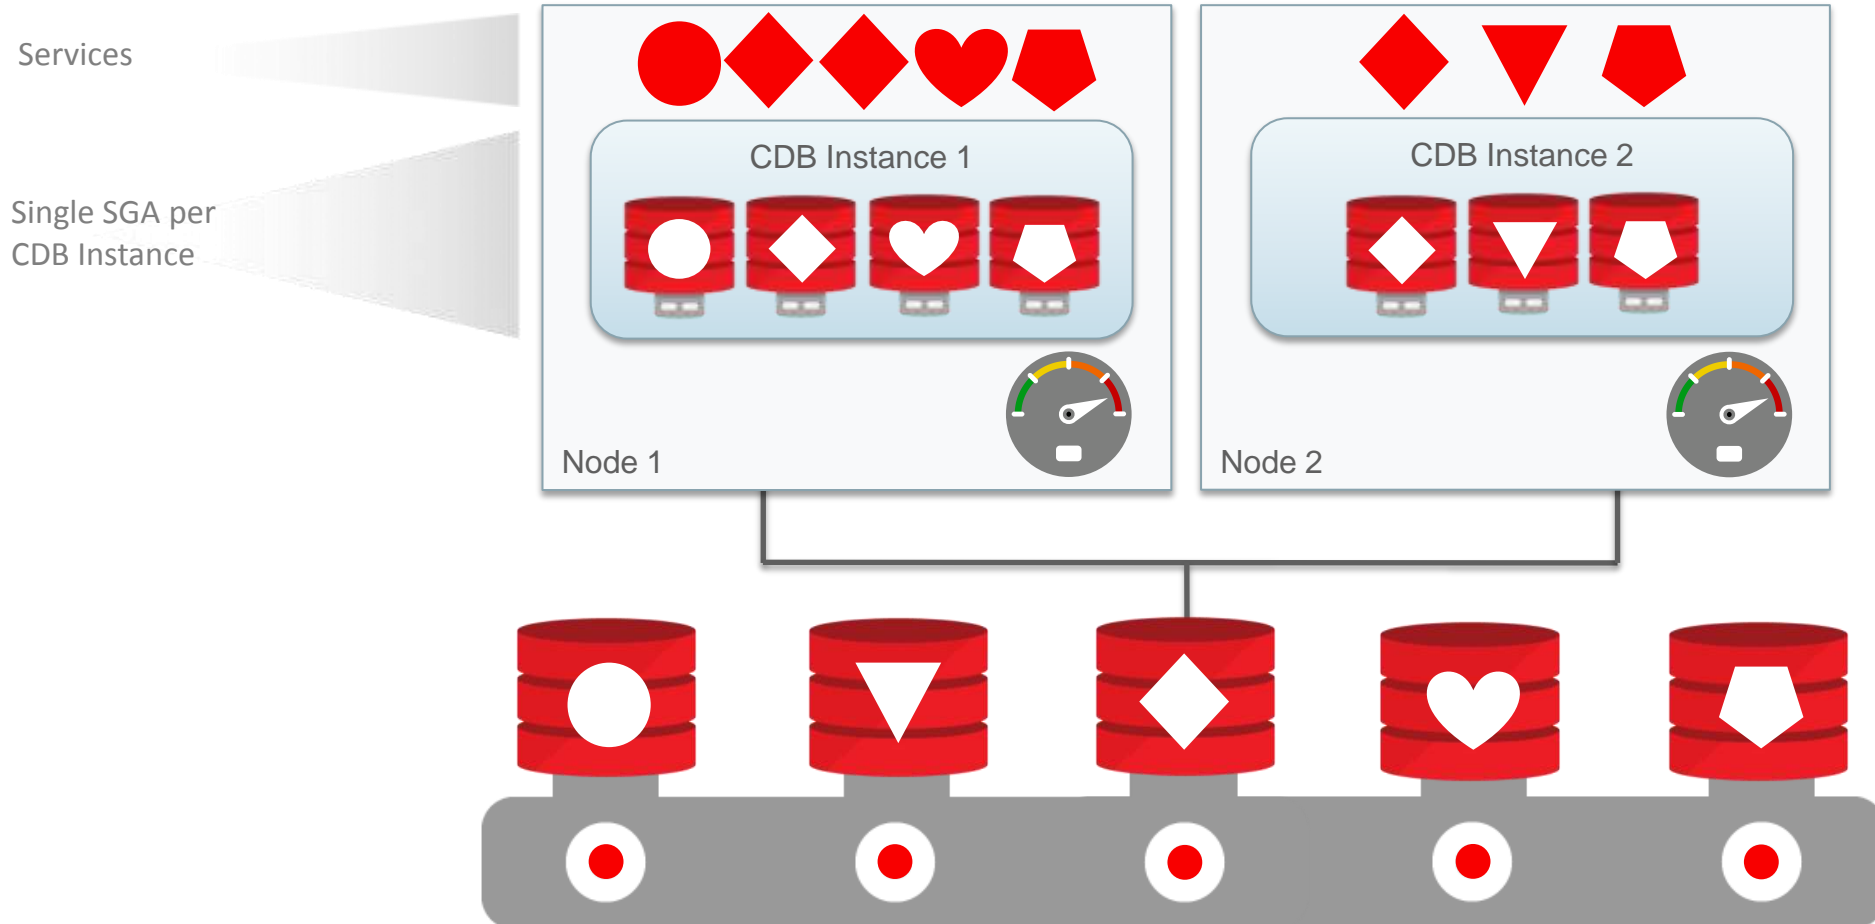

Multitenant and RAC: Agility, Availability & Scalability

- Single CDB
- Single instance per node
- PDBs may be configured with “singleton” affinity to a specific node
 - Present in “mounted” state in other nodes
- PDBs may be uniformly available in all nodes

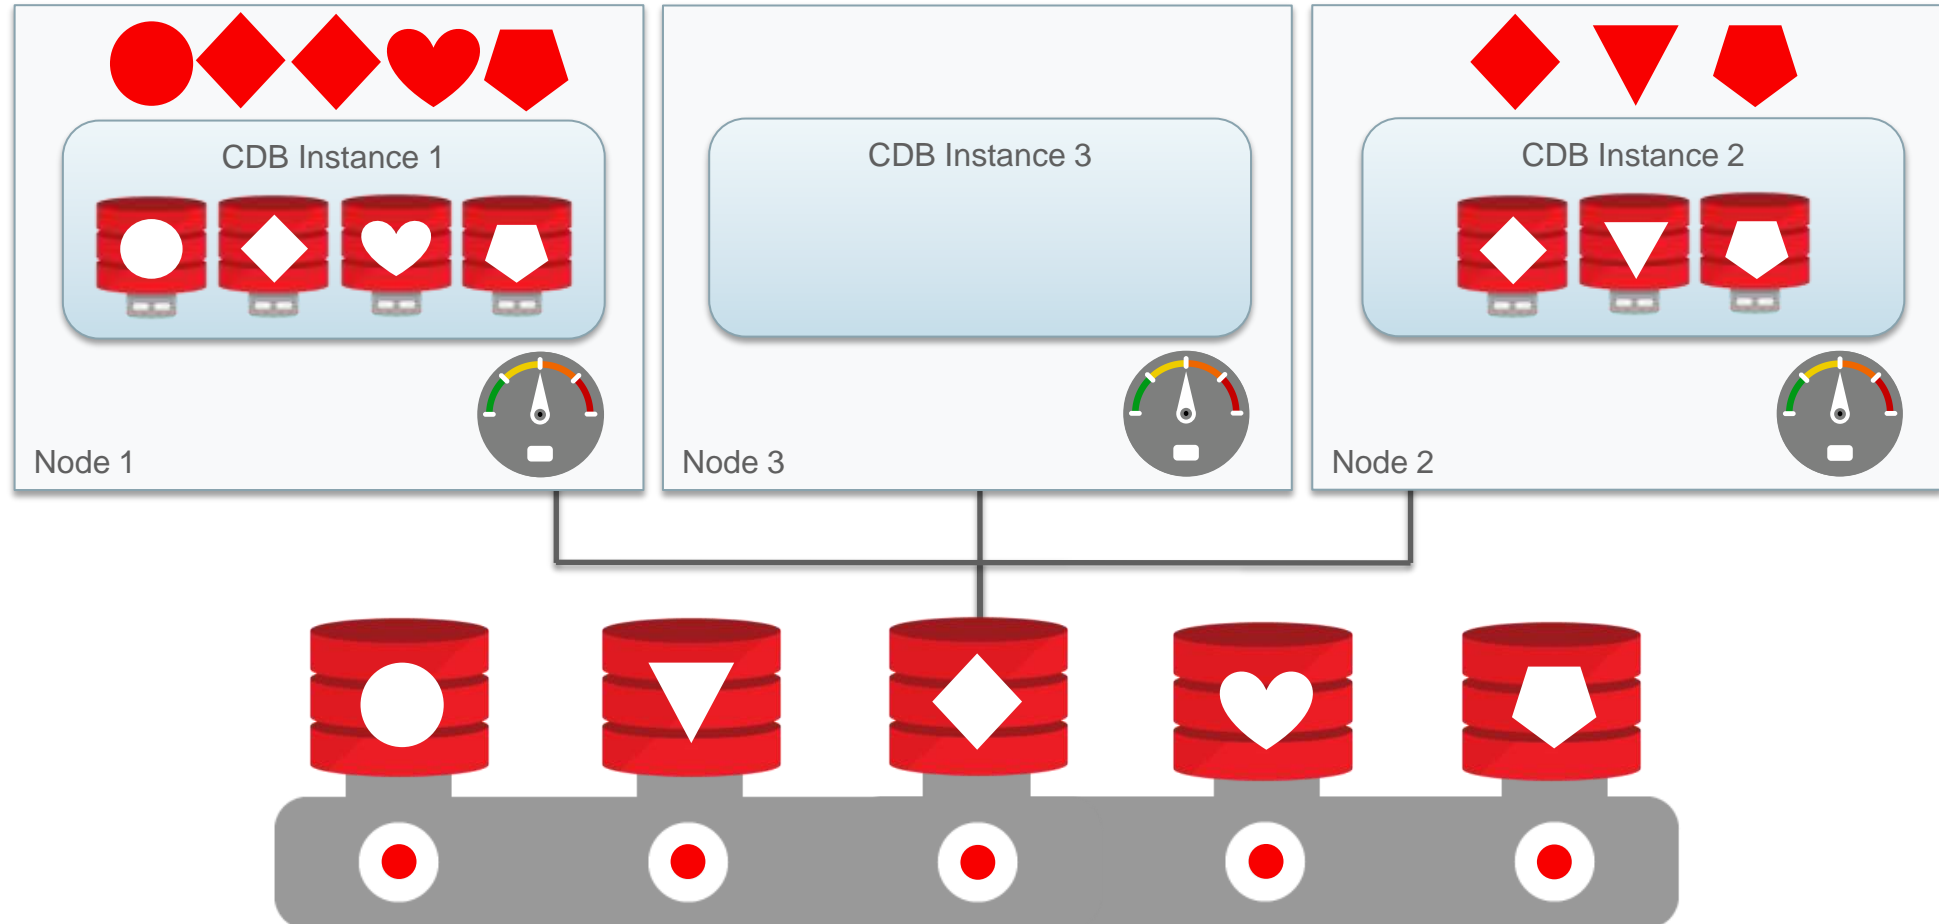

Improved Agility With Changing Workloads

Expand cluster to support flexible consolidation model

Improved Agility With Changing Workloads

Expand cluster to support flexible consolidation model

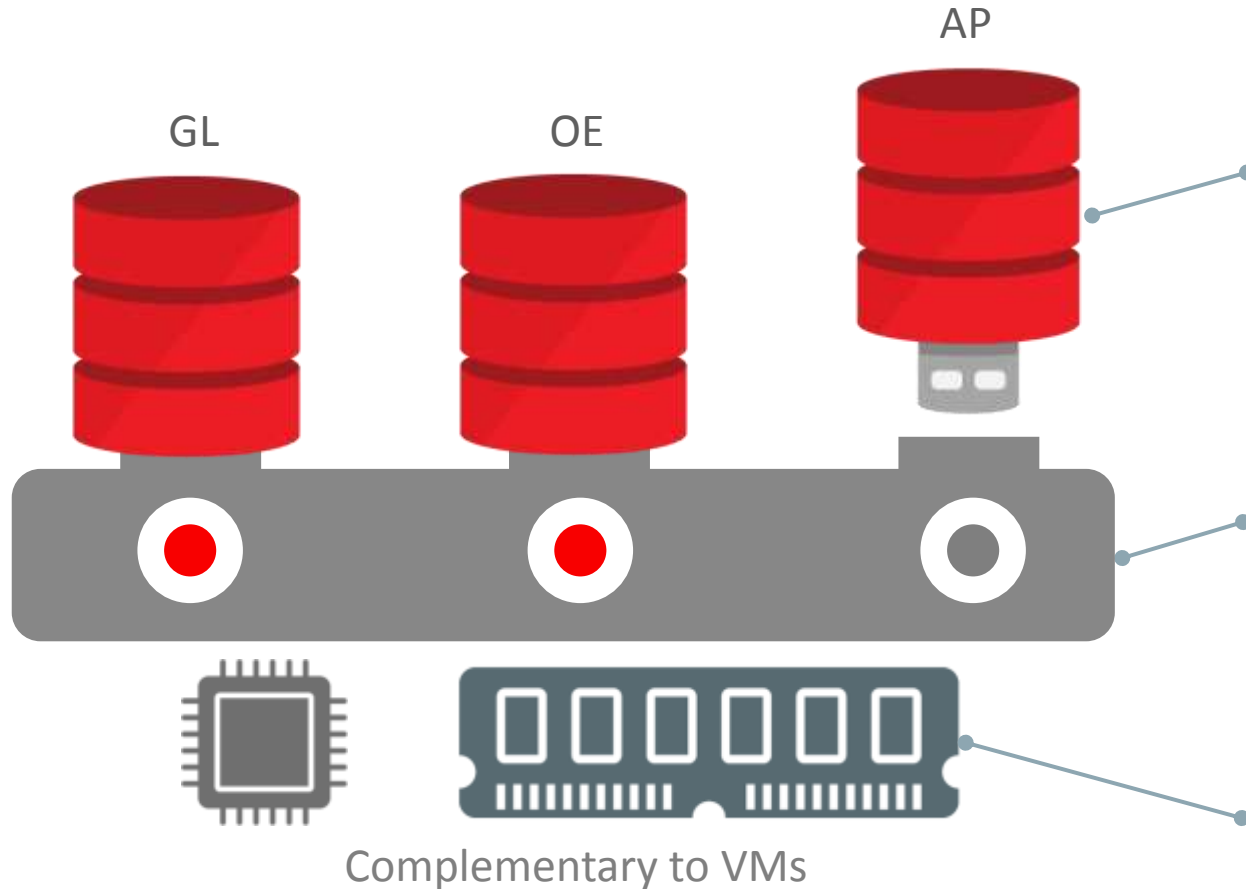

Multitenant Provides Agility for New Projects

Fast Provisioning, Snapshot Clones

Advantages of Multitenant Architecture

Reduced CapEx & OpEx, Increased Agility, Easy to Adopt and Use

Self-contained PDB for each application

- Applications run unchanged
- Rapid provisioning (via clones)
- Portability (via pluggability)

Common operations performed at CDB level

- Manage many as one (patch, upgrade, HA, backup)
- Granular control when appropriate

Shared memory and background processes

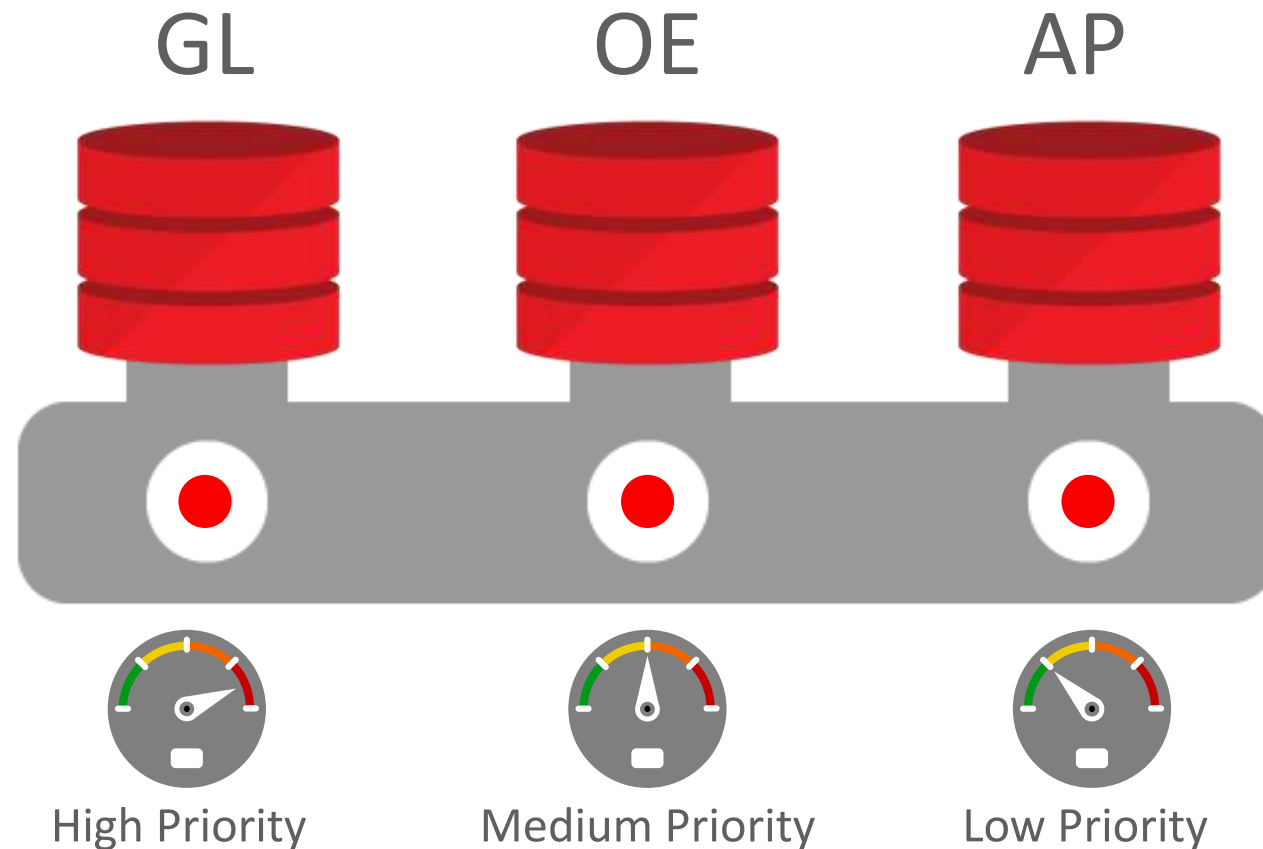

- More applications per server

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment**
- 5 Upgrading to Multitenant
- 6 Use Cases

Managing Shared Resources

Resource management in a multitenant environment

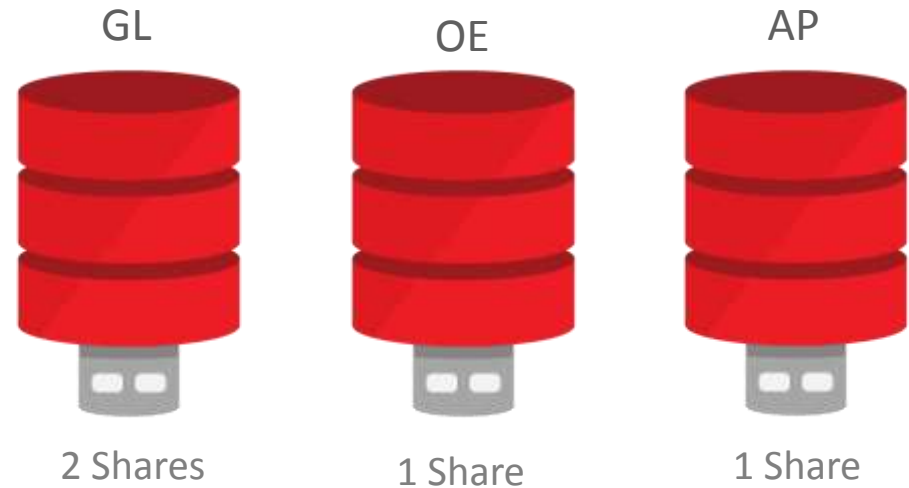

Managing Resources Between PDBs

- Using Resource Manager, you can control
 - CPU
 - Exadata I/O
 - Sessions
 - Parallel execution servers
- Simple-yet-powerful policies configured in terms of:
 - A number of shares allocated to each PDB
 - A “cap” (a.k.a. maximum utilization limit) may be applied to each PDB

Manage CPU

A CDB Resource Plan uses *shares* to specify how CPU is distributed between PDBs

Pluggable Database	Shares	Guaranteed CPU	Maximum CPU
GL	2	$2/4 = 50\%$	100%
OE	1	$1/4 = 25\%$	100%
AP	1	$1/4 = 25\%$	100%

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment
- 5 Upgrading to Multitenant
- 6 Use Cases

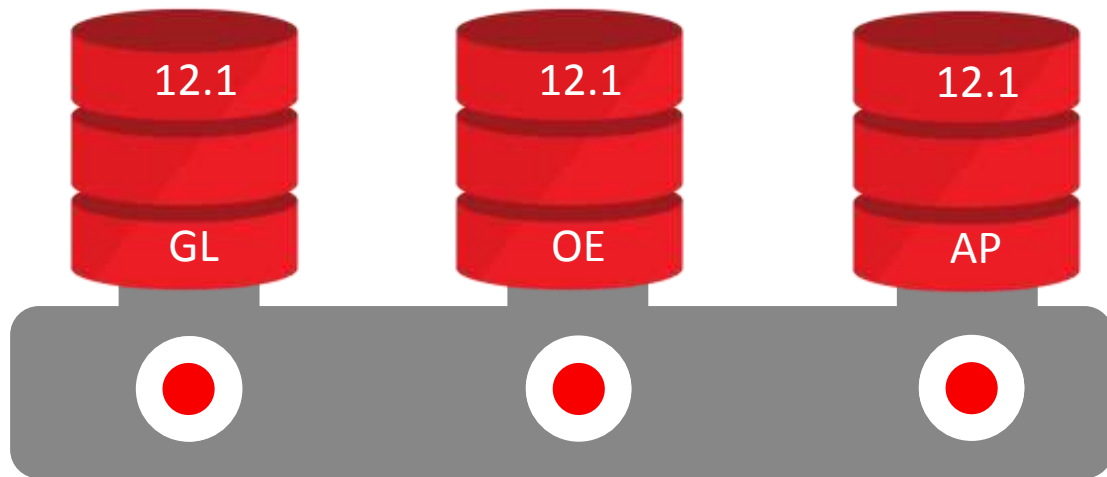

Upgrading to Multitenant

Step 1. Upgrade databases in place

Upgrading to Multitenant

Step 2. Plug in upgraded databases

Upgrading to Multitenant

~~Step 3. Change applications to work with Multitenant~~

- No application changes required!

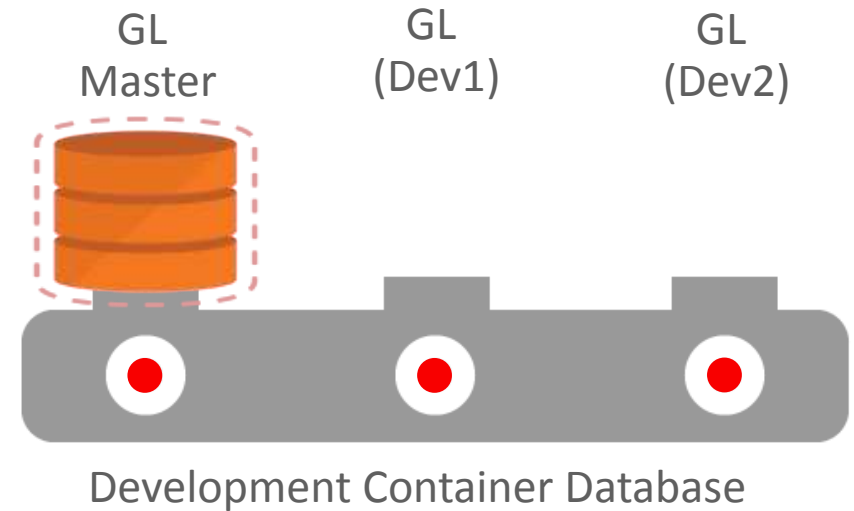

Agenda

- 1 Rethinking Architecture for the Database Cloud
- 2 Multitenant Architecture
- 3 Capabilities Enabled
- 4 Managing Multitenant Environment
- 5 Upgrading to Multitenant
- 6 Use Cases

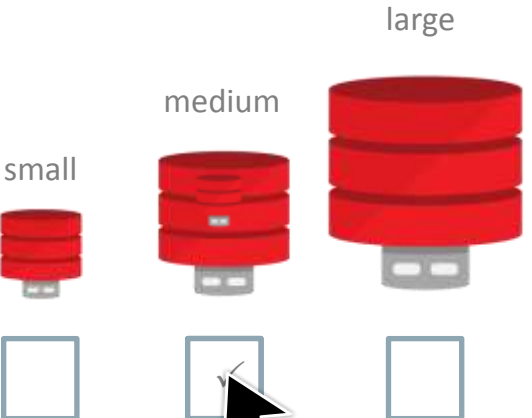

Multitenant for Development and Testing

Fast, flexible copy and snapshot of pluggable databases

Oracle Multitenant for Database as a Service

Pick from standard sizes and service levels

GOLD

SILVER

BRONZE

Consolidation of Disparate Applications

Simplify, standardize, reduce risk, lower costs and upgrade SLAs with Multitenant

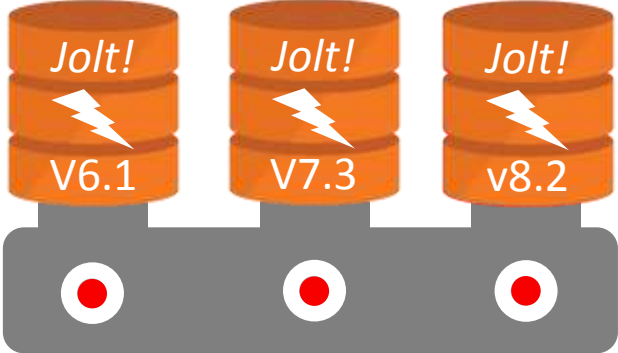

Oracle Multitenant for Software as a Service

Multitenancy implemented by the Database, not the Application

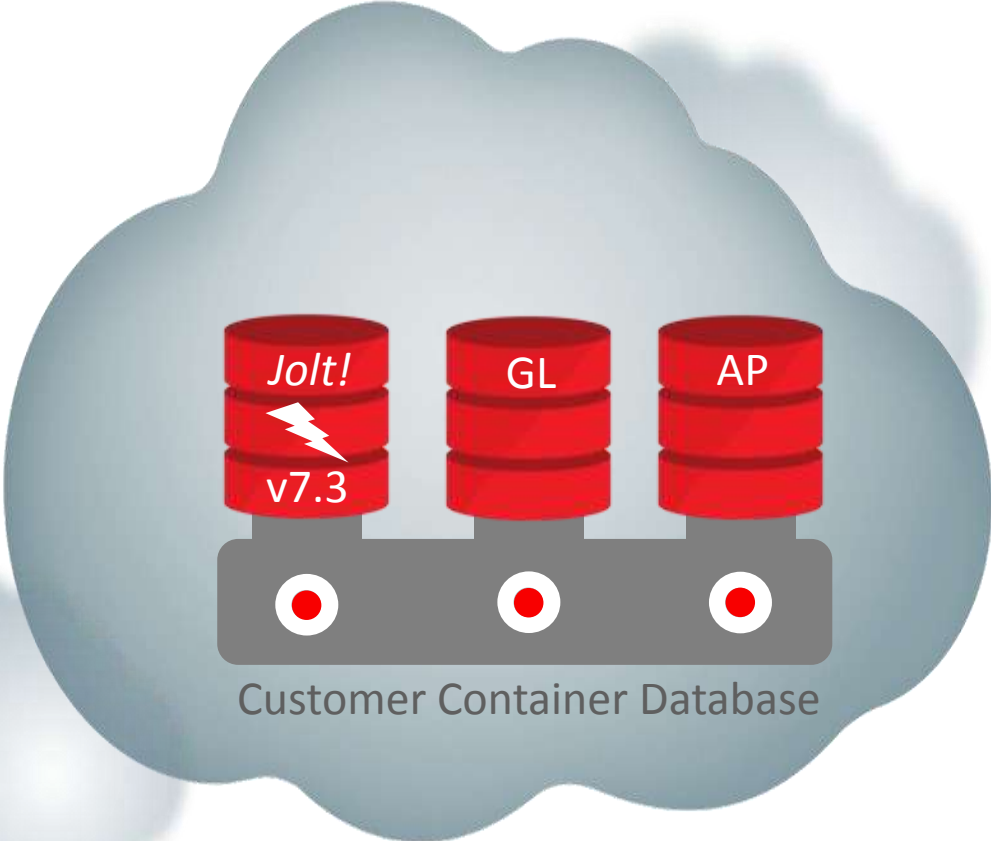

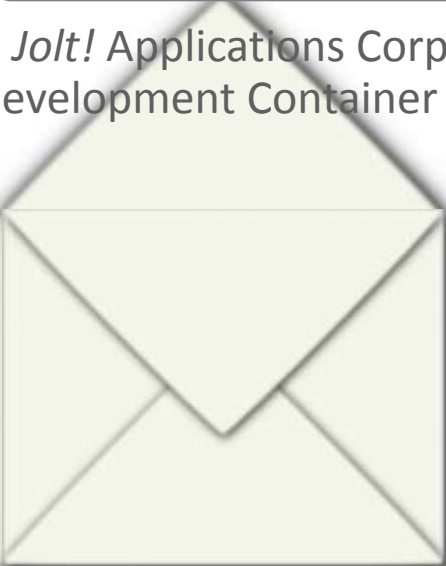

Multitenant. Perfect for ISVs

Packaged apps and reference data are easily distributed

Jolt! Applications Corporation
Development Container Database

Customer Container Database

Plug Into the Cloud with Oracle Multitenant

A pluggable database is a portable database – easy to migrate to the cloud

Use Cases

1. Development / Testing – *start here!*
2. Database as a Service (DBaaS)
3. Consolidation of Disparate Applications
4. Software as a Service (SaaS)
5. Distribution of Packaged Apps and Data
6. Migration of Databases to the Cloud
7. ...many others!

Key Benefits

Benefit	Capability Enabled
Minimize CapEx	<ul style="list-style-type: none">• More applications per server
Minimize OpEx	<ul style="list-style-type: none">• Manage many as one (reduced patching!)• Standardized procedures & service levels• Enable self-service provisioning
Maximize Agility	<ul style="list-style-type: none">• Snapshot cloning for development and testing• Portability through “pluggability”• Scalability with RAC
Easy	<ul style="list-style-type: none">• To Adopt: Applications run unchanged• To Use: Interface is SQL

Integrated Cloud

Applications & Platform Services
